

S2 Fig. Other tests of the effects of scent on reproductive recovery. We did not see a statistically significant difference in recovery when hermaphrodites and males were stressed separately and recovered together on plates scented with either hermaphrodite or male scent (column 2 compared to column 3 $P = 0.77$, binomial test). Scent from L3 larval worms did not improve recovery above background (column 4 compared to control $P = 0.51$, binomial test). Error bars denote \pm SD among separate trials. Results described by white columns are from data presented in Fig. 1B. See S1 Table for numbers of independent trials and worms tested in each trial.
