

Figure S14. Ovulation during heat stress (29°C) in wild type and mutant worms. The average number of embryos in the gonad (left) and eggs laid (right) for N2, *itr-1(gf)*, *crt-1* and N2 raised on 10 uM dantrolene. The total number of ovulations at 29°C can be obtained by adding values in each of these two categories.
