

Supplementary Figure 1. Mean age at diagnosis of pulmonary fibrosis is lowest among Black subjects. Stratification by racial subgroup depicts (A) The CHICAGO cohort (n=459, White red, n=332; Black grey, n=84; Hispanic orange, n=35; and Asian green, n=8); (B) The CALIFORNIA cohort (n=646, White red, n=517; Black grey, n=21; Hispanic orange, n=70; and Asian green, n=36); (C) The TEXAS cohort (n=670, White red, n=528; Black grey, n=55; Hispanic orange, n=68; and Asian green, n=19); and (D) The IPFNet cohort (n=259, White red, n=236; Black grey, n=2; Hispanic orange, n=14; and Asian green, n=7). Group comparisons across racial subgroups conducted using Bartlett's one-way analysis of variance (ANOVA) test. In the violin plots, the white circle represents the median of the data; the black vertical box indicates the interquartile range; the thin blue vertical line indicates 1.5x the interquartile range and the density curves depicts the distribution of numeric data for all sample points within each group.

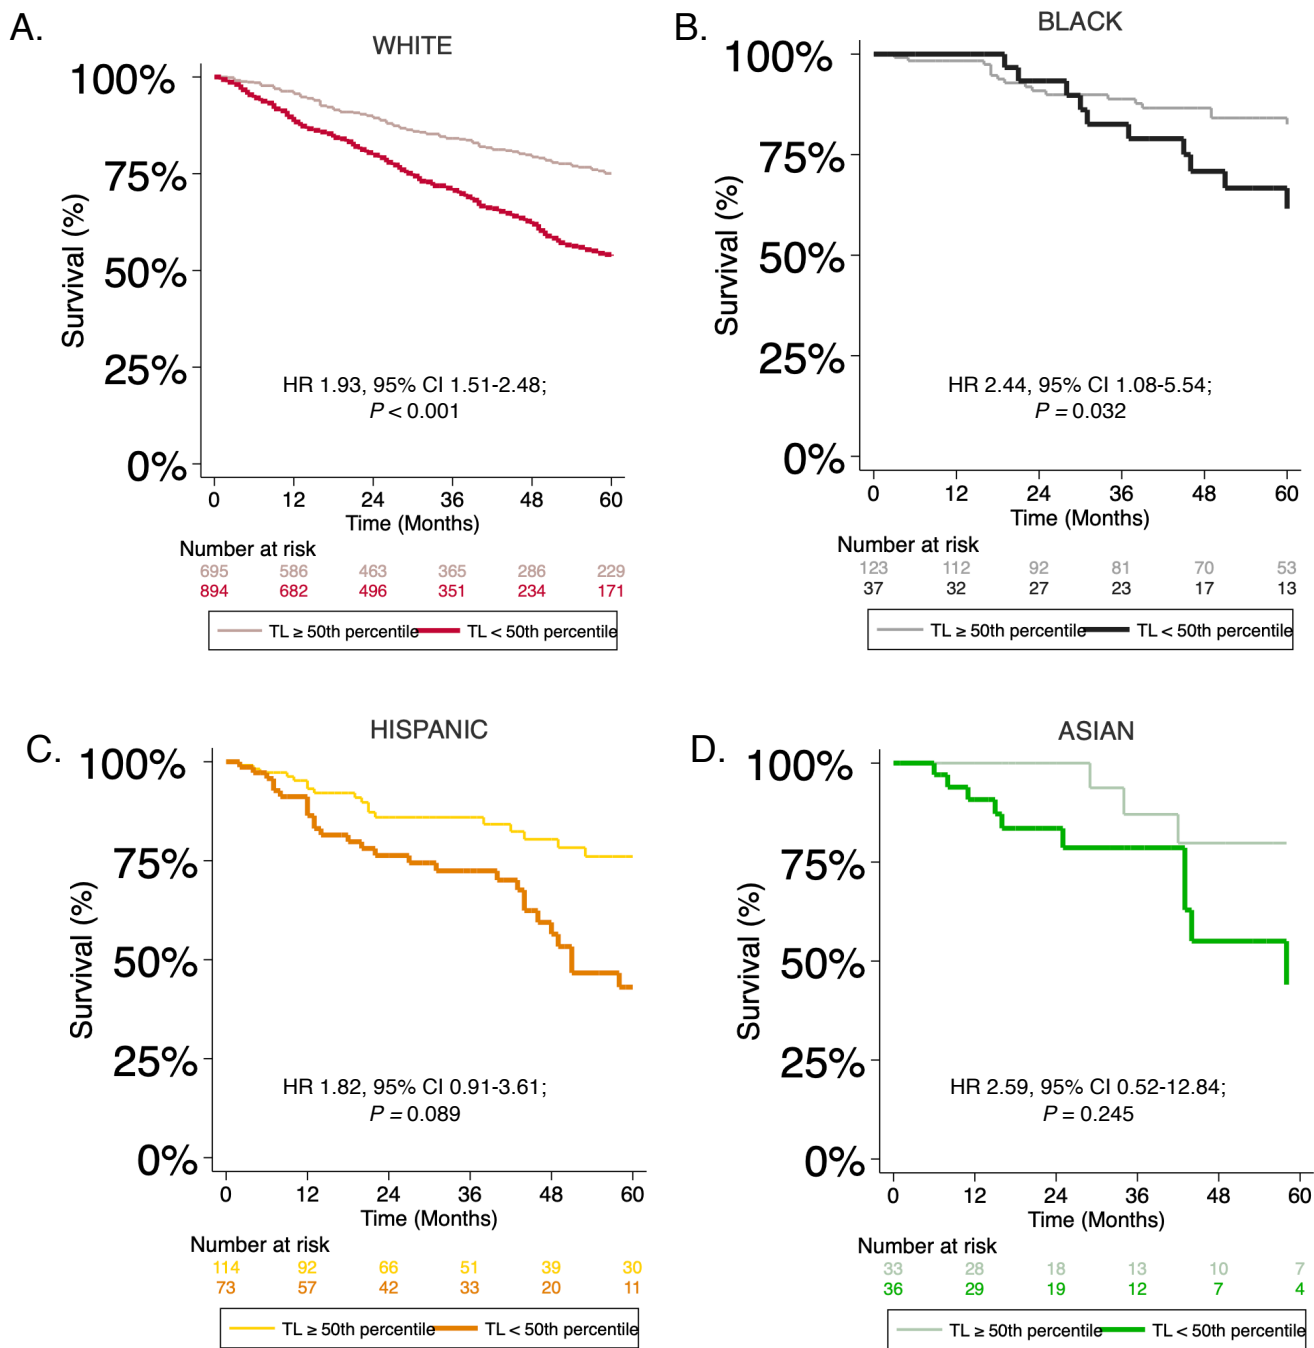

Supplementary Figure 2. Mean observed minus expected (O-E; age and gender-adjusted) leukocyte telomere length (TL) is similar in White subjects propensity-matched to Black subjects with pulmonary fibrosis (PF). Mean age and gender-adjusted TL (O-E) of 0.33 (0.56) in White subjects (n=106), and 0.37 (0.49) in Black subjects (n=162), respectively. Thick short black lines show the median for each subgroup. The black dotted line shows the median TL; blue dotted lines show approximate age-adjusted prediction bands in percentiles for each cohort. *Group comparisons between white subjects (#) and other racial subgroups conducted using the two-sided student's T-test; NS=not significant ($P \geq 0.05$).*

Supplementary Figure 3. Shorter leukocyte telomere length (TL) consistently predicts worse survival patterns in pulmonary fibrosis. Survival stratified by age and gender-adjusted TL below the median ($TL_{<50\%}$) vs. above the median ($TL_{\geq 50\%}$) in **(A)** University of Chicago (CHICAGO) cohort ; **(B)** University of California, Davis and University of California, San Francisco (CALIFORNIA) cohort; **(C)** University of Texas, Southwestern (UTSW) cohort; **(D)** Idiopathic Pulmonary Fibrosis Network Clinical Trials (IPFNet) cohort. Unadjusted Cox proportional hazard ratio (HR) and 95% confidence interval of this mortality hazard estimate depicted with its respective P-value for each cohort. **(E)** Plot of p-values for the association of mortality hazard ratios (HR) in PF with transformed TL (negative log-transformed inverse of one minus percentile TL); HR depicted for decreasing centiles of TL compared to highest centile of TL. **(F)** Survival stratified by age and gender-adjusted TL in quartiles for each center; CHICAGO (n=459), CALIFORNIA (n=658), TEXAS (n=670), IPFNET (n=259); TOTAL (n=2046). The navy blue boxes within the forest plot represents the point estimate for the mortality hazard ratio for each cohort, the thin horizontal line represents its 95% confidence interval, the vertical line is the line of no effect, and the diamond represents the overall effect estimate.

Supplementary Figure 4. Shorter leukocyte telomere length (TL) consistently predicts worse survival patterns in pulmonary fibrosis (PF) subtypes. Survival stratified by age and gender-adjusted TL below the median ($TL_{<50\%}$) vs. above the median ($TL_{\geq 50\%}$) in (A) idiopathic pulmonary fibrosis (IPF); (B) interstitial pneumonia with autoimmune features (IPAF); (C) connective tissue disease-related interstitial lung disease (CTD-ILD); (D) fibrotic hypersensitivity pneumonitis (fHP) (E) unclassifiable or other PF subtypes. Unadjusted Cox proportional hazard ratio (HR) and 95% confidence interval of this mortality hazard estimate depicted with its respective P-value for each PF subtype.

Supplementary Figure 5. Leukocyte Telomere Length (TL) below the 50th percentile consistently predicts worse survival across diverse racial groups with pulmonary fibrosis. Survival pattern by TL in (A) White subjects; (B) Black subjects; (C) Hispanic subjects; and (D) Asian subjects. Unadjusted Cox proportional hazard ratio (HR) and 95% confidence interval of this mortality hazard estimate depicted with its respective P-value for each racial/ethnic group.

Supplementary Table 1. Characteristics of Study Participants with Pulmonary Fibrosis

Characteristics*	CHICAGO (n=459)	CALIFORNIA (n=658)	TEXAS (n=670)	IPFNET (n=259)	P-value#

4-5	0.10 (0.30)	0.11 (0.34)
>5	-0.16 (0.52)	-0.17 (0.58)

**Standardized telomere length across study population presented as means (SD). Telomere lengths unadjusted for age or sex. Exception for participants without available components for ILD-GAP score estimation (White n=99, Black n=22, Hispanic n=15, Asian n=3). ILD-GAP=interstitial lung disease, gender, age, physiology [FVC=forced vital capacity, DL_{CO}=diffusing capacity of the lungs] score.*
